

# Example

If you can read this then you should understand what is meant by

[PDF|PS|TeX]

so we can pleasantly write such expressions as

$$7x = 13 \pmod{17}$$

and

$$26^5 = 11881376$$

which is the number of 5 letter messages using the (currently standard) alphabet. Maple computed this for me.

---

It will be nice when mathematical  
typography is part of html.
