

Taylor series (with radii of convergence given):

$$\begin{aligned}\frac{1}{1-x} &= 1 + x + x^2 + \cdots = \sum_0^{\infty} x^n, \quad |x| < 1 \\ e^x &= 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots = \sum_0^{\infty} \frac{x^n}{n!}, \quad |x| < \infty \\ \cos x &= 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots = \sum_0^{\infty} \frac{(-1)^n x^{2n}}{(2n)!}, \quad |x| < \infty \\ \sin x &= x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots = \sum_0^{\infty} \frac{(-1)^n x^{2n+1}}{(2n+1)!}, \quad |x| < \infty\end{aligned}$$

The Gamma function. For $x > 0$, $\Gamma(x) = \int_0^{\infty} t^{x-1} e^{-t} dt$.

If x is not 0 or a negative integer, $\Gamma(x+1) = x\Gamma(x)$.

If n is a non-negative integer, $\Gamma(n+1) = n!$. $\Gamma(1/2) = \sqrt{\pi}$.

The Method of Frobenius—solution forms:

$$\begin{aligned}y_1(x) : \quad &x^{r_1} \sum_{n=0}^{\infty} a_n x^n \\ y_2(x) : \quad &x^{r_2} \sum_{n=0}^{\infty} b_n x^n \quad \text{or} \quad y_1(x)(\ln x) + x^{r_2} \sum_{n=1}^{\infty} c_n x^n \quad \text{or} \quad Cy_1(x)(\ln x) + x^{r_2} \sum_{n=0}^{\infty} c_n x^n.\end{aligned}$$

The Method of Frobenius—useful formula:

$$u'' + p(x)u' + q(x)u = \frac{C}{x^2} [y_1(x) - xp(x)y_1(x) - 2xy'_1(x)].$$

Bessel Functions.

A. The Bessel equation of order ν : $x^2 y'' + xy' + (x^2 - \nu^2)y = 0$.

B. Bessel functions:

$$\begin{aligned}J_{\nu}(x) &= \left(\frac{x}{2}\right)^{\nu} \sum_{k=0}^{\infty} \frac{(-1)^k}{k!\Gamma(\nu+k+1)} \left(\frac{x}{2}\right)^{2k} \\ J_{-\nu}(x) &= \left(\frac{x}{2}\right)^{-\nu} \sum_{k=0}^{\infty} \frac{(-1)^k}{k!\Gamma(k-\nu+1)} \left(\frac{x}{2}\right)^{2k} \\ Y_{\nu}(x) &= \frac{(\cos \nu\pi)J_{\nu}(x) - J_{-\nu}(x)}{\sin \nu\pi}, \quad \text{if } \nu \neq 0, 1, 2, \dots \\ Y_n(x) &= \lim_{\nu \rightarrow n} Y_{\nu}(x), \quad \text{if } n = 0, 1, 2, \dots\end{aligned}$$

The Fourier transform:

$$\mathcal{F}\{f(x)\} = \int_{-\infty}^{\infty} f(x)e^{-i\omega x} dx, \quad \mathcal{F}^{-1}\{\hat{f}(\omega)\} = \frac{1}{2\pi} \int_{-\infty}^{\infty} \hat{f}(\omega)e^{i\omega x} d\omega.$$

d'Alembert's solution:

$$u(x, t) = F(x-ct) + G(x+ct) = \frac{1}{2}(f(x-ct) + f(x+ct)) + \frac{1}{2c} \int_{x-ct}^{x+ct} g(z) dz$$

Various Fourier-type expansions:

We write $f(x) \sim \text{series}$ to indicate that the given series is some Fourier-type expansion of $f(x)$. All the formulas for coefficients come from the formula

$$c_n = \frac{\langle f, \varphi_n \rangle}{\langle \varphi_n, \varphi_n \rangle}$$

with $\varphi_1, \varphi_2, \dots$ a complete orthogonal set for $C_p[-\ell, \ell]$ or $C_p[0, L]$.

$$\left. \begin{aligned} f(x) &\sim a_0 + \sum_{n=1}^{\infty} \left[a_n \cos \frac{n\pi x}{\ell} + b_n \sin \frac{n\pi x}{\ell} \right]; \\ a_0 &= \frac{1}{2\ell} \int_{-\ell}^{\ell} f(x) dx, \quad a_n = \frac{1}{\ell} \int_{-\ell}^{\ell} f(x) \cos \frac{n\pi x}{\ell} dx, \quad b_n = \frac{1}{\ell} \int_{-\ell}^{\ell} f(x) \sin \frac{n\pi x}{\ell} dx. \end{aligned} \right\} \quad (1)$$

$$f(x) \sim \sum_{n=-\infty}^{\infty} c_n e^{in\pi x/\ell}; \quad c_n = \frac{1}{2\ell} \int_{-\ell}^{\ell} f(x) e^{-in\pi x/\ell} dx. \quad (2)$$

$$\left. \begin{aligned} f(x) &\sim a_0 + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{L} \quad (0 < x < L); \\ a_0 &= \frac{1}{L} \int_0^L f(x) dx, \quad a_n = \frac{2}{L} \int_0^L f(x) \cos \frac{n\pi x}{L} dx. \end{aligned} \right\} \quad (3)$$

$$f(x) \sim \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{L} \quad (0 < x < L); \quad b_n = \frac{2}{L} \int_0^L f(x) \sin \frac{n\pi x}{L} dx. \quad (4)$$

$$f(x) \sim \sum_{n=1,3,5,\dots} a_n \cos \frac{n\pi x}{2L} \quad (0 < x < L); \quad a_n = \frac{2}{L} \int_0^L f(x) \cos \frac{n\pi x}{2L} dx. \quad (5)$$

$$f(x) \sim \sum_{n=1,3,5,\dots} b_n \sin \frac{n\pi x}{2L} \quad (0 < x < L); \quad b_n = \frac{2}{L} \int_0^L f(x) \sin \frac{n\pi x}{2L} dx. \quad (6)$$

Some antiderivatives:

$$\begin{aligned} \int e^{-ax} \sin(bx) dx &= -\frac{e^{-ax}}{a^2 + b^2} (a \sin(bx) + b \cos(bx)) + C \\ \int e^{-ax} \cos(bx) dx &= \frac{e^{-ax}}{a^2 + b^2} (-a \cos(bx) + b \sin(bx)) + C \\ \int x \cos(bx) dx &= \frac{\cos(bx)}{b^2} + \frac{x \sin(bx)}{b} + C \quad \int x \sin(bx) dx = \frac{\sin(bx)}{b^2} - \frac{x \cos(bx)}{b} + C \end{aligned}$$

Some trig identities:

$$\begin{aligned} \cos^2 x &= \frac{1 + \cos(2x)}{2} & \sin^2 x &= \frac{1 - \cos(2x)}{2} \\ \cos(A) \cos(B) &= (1/2) [\cos(A+B) + \cos(A-B)] \\ \sin(A) \cos(B) &= (1/2) [\sin(A+B) + \sin(A-B)] \\ \sin(A) \sin(B) &= (1/2) [\cos(A-B) - \cos(A+B)] \end{aligned}$$

Sturm-Liouville problem:

$$[p(x)y']' + q(x)y + \lambda w(x)y = 0, \quad \langle f(x), g(x) \rangle_w = \int_0^L f(x)g(x)w(x) dx$$
